

TECH BULLETIN: Calipers With Slide Pins

SUBJECT:

This Brake System design uses Caliper Bolt Slide Pins and pad clips for proper braking.

ISSUE:

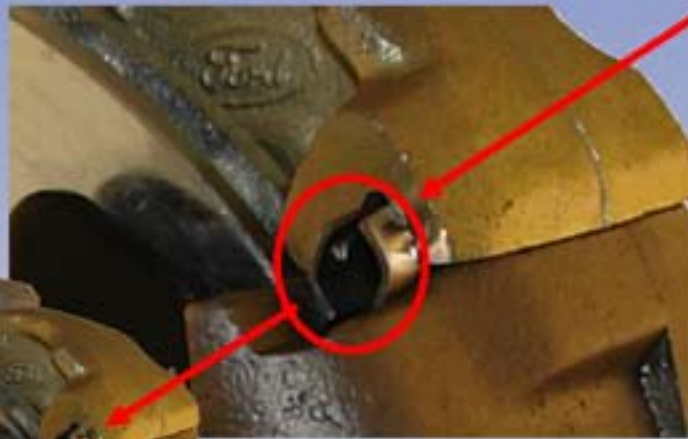

Caliper Bolt Slide Pins utilize a stop tab on each end of the pin to maintain proper operation. These tabs typically are destroyed during removal. Reusing these pins with bent or crushed tabs can adversely affect the braking system, including noise, premature pad wear, and reduced braking performance.

SOLUTION:

Install a new Brake Hardware Kit that includes new Caliper Bolt Slide Pins to ensure a proper brake job. New pad clips or anti-rattle springs, where applicable, are included to make certain a quality job is completed.

Other models may include anti-rattle springs.

OE brake designs now rely on brake hardware to play a larger role in the brake system.

Installing new brake hardware can help the entire brake system function properly.
